# Notations

Audio separation 00●000 00	Spectrogram models 0000 00	KAM Light 000	
<b>—</b> : c			

# Time frequency masking

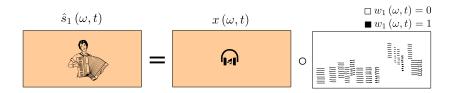

• Each source STFT  $s_j(\omega, t)$  is obtained by *filtering* the mixture

$$\hat{s}_{j}(\omega,t) = x(\omega,t) w_{j}(\omega,t)$$

- Underdetermined separation  $\Rightarrow w_i$  varies with both  $\omega$  and t
- Waveforms obtained by inverse STFT

Many different ways to get a Time-Frequency (TF) mask  $w_j(\omega, t)$ 

Audio separation 000●00 00	Spectrogram models 0000 00	KAM Light 000	Results 00
Time frequency	masking		

- $s_j(\omega, t)$  is assumed equal either to  $x(\omega, t)$  or to 0
- A classification task over the mixture STFT x
  - $\Rightarrow$  based on features
    - pitch detection+harmonics selection (CASA)panning position (DUET)

# Getting the mask

Binary masking yields **musical noise**  $\Rightarrow$  Soft masking  $w_j(\omega, t) \in [0\,1]$  is better!

Example: Wiener filtering for Gaussian processes

Sources energies  $p_j(\omega, t) \ge 0$  add up to get mix energy

$$\sum_{j} p_{j}(\omega, t)$$

•  $w_j(\omega, t)$  taken as proportion of source j in mix

$$w_{j}\left(\omega,t
ight)=rac{p_{j}\left(\omega,t
ight)}{\sum_{j'}p_{j'}\left(\omega,t
ight)}\in\left[0\,1
ight]$$

# The need for spectrograms models

- For each time frequency bin  $(\omega, t)$ 
  - ightarrow we have J unknowns  $p_{j}\left(\omega,t
    ight)\geq0$
  - ightarrow we have 1 observation  $x(\omega,t)\in\mathbb{C}$
  - $\Rightarrow$  The problem is ill-posed
- $\Rightarrow$  We need to:
  - $\rightarrow$  exploit redundancies (e.g. multichannel data)
  - $\rightarrow~$  reduce the number of parameters

We should use prior knowledge on  $p_i$ 

### ⇒ exploit expected structure of spectrograms

# Kernel spectrogram models principles

- NMF is a **global** single model for all of *p<sub>j</sub>*
- Sometimes, our knowledge is only local
  - $\Rightarrow$  We assume  $p_{j}(\omega, t)$  is equal to some **neighbours**  $\mathcal{I}_{j}(\omega, t)$

## Example: harmonic/percussive local models

- Percussive sounds are locally constant through frequency
- Harmonic sounds are locally constant through time

# Kernel backfitting algorithm

### Input

Mixture STFT  $x(\omega, t)$ Neighbourhoods  $\mathcal{I}_j(\omega, t)$ , also called "proximity kernels"

## Initialization:

 $orall j, \hat{p}_{j}\left(\omega,t
ight) \leftarrow |x\left(\omega,t
ight)|^{2}$ : simply take mix spectrogram

### Iterate

## Separation with Wiener filtering

compute

estimates 
$$\hat{s}_{j}(\omega, t) = \left[\hat{p}_{j}(\omega, t) / \sum_{j'} \hat{p}_{j'}(\omega, t)\right] x(\omega, t)$$
  
Spectrograms fitting

 $\hat{p}_{j}(\omega, t) \leftarrow \text{median filter } |\hat{s}_{j}|^{2} \text{ with kernel } \mathcal{I}_{j}(\omega, t)$ 

## **Output**: source estimates $\hat{s}_j$

# Scalability issues

Kernel models: no compact parameterization

 $\Rightarrow$  all spectrograms must be stored in full resolution

for 10 sources and a full length track:

approximately 32Gb of RAM needed!

Liutkus\*, Fitzgerald, Rafii

Audio separation 000000 00	Spectrogram models 0000 00	KAM Light 0●0	

# Low-rank models for compression

$$p_{j}(\omega, t) = \sum_{k=1}^{K} W(\omega, k) H(k, t)$$

## Different possible approaches

## Nonnegative matrix factorization

 W and H have nonnegative entries meaningful decompositions, but slow
 Truncated singular values decompositons (SVD)
 W and H are real not physically meaningful, but fast

## After filtering, compress spectrograms with a low-rank model

# Kernel Additive Modelling: conclusion

- A general framework for combining different kernel models
- Handles multichannel, full-length mixtures
- Easy to implement and fast algorithms
  - $\Rightarrow$  full demo at www.loria.fr/~aliutkus/kaml/

# To go further

## Formalization

- $\Rightarrow$  optimization framework with robust cost-functions
- $\Rightarrow$  equivalence with EM algorithm in some cases

# Combination with other techniques

- Learning source kernels automatically?
- $\Rightarrow$  maximizing size of kernel (robustness)
- $\Rightarrow$  maximizing invariance to median filtering
